Interesting dispatch in Current Biology by Marco Tamietto and David Leopold on the recent study by [Koulla](#) , [Jan](#) , [David](#) and [Concetta](#) about [Area Prostriata in the Human Brain](#) ! [PDF](#)

Human area Prostriata is a small, unstudied portion of the visual brain set deep in the calcarine sulcus, next to V1. A recent neuroimaging study in humans indicates that this area is specialized to respond to rapidly moving stimuli in the far periphery, consistent with single-unit responses in other mammals.
